Secuencia infinita $\{\phi_n(x)\}$ integrable en $[a, b]$ y

$$\int_a^b \phi_i(x)\phi_j(x)\, dx = 0, \quad i \neq j$$

Supongamos que existe

$$\int_a^b f(x)\, dx$$

y

$$f(x) = \sum_{n=1}^{\infty} c_n \phi_n(x)$$

$$c_3 = \color{red}{?}$$

$$f(x)\phi_3(x) = \sum_{i=1}^{\infty} c_n \phi_n(x)\phi_3(x)$$

$$\int_a^b f(x)\phi_3(x)\, dx =$$

$$\int_a^b \sum_{i=1}^{\infty} c_n \phi_n(x)\phi_3(x)\, dx =$$

$$\sum_{i=1}^{\infty} \int_a^b c_n \phi_n(x)\phi_3(x)\, dx =$$

$$c_3 \int_a^b \phi_3^2(x)\, dx$$

$$c_k = \frac{\int_a^b f(x)\phi_k(x)\, dx}{\int_a^b \phi_k^2(x)\, dx} \quad (1)$$

Definición

Producto interno:

$$\langle \phi_i, \phi_j \rangle = \int_a^b \phi_i(x)\phi(j)(x)\, dx$$

Con c_k definida por (**??**):

$$f(x) \sim \sum_{n=1}^{\infty} c_n \phi_n(x) = F(x)$$

$F(x)$ es la **representación de Fourier** de $f(x)$ con respecto de $\{\phi_n(x)\}$.

Se puede demostrar:

$$\int_a^b \left[f(x) - \sum_{k=1}^{n} c_k \phi_k(x) \right]^2 dx \leq$$

$$\int_a^b \left[f(x) - \sum_{k=1}^{n} d_k \phi_k(x) \right]^2 dx$$

Caso especial:

$$\{1, \cos x, \cos 2x, \cos 3x, \cdots ,$$

$$\operatorname{sen} x, \operatorname{sen} 2x, \operatorname{sen} 3x, \cdots \}$$

ortogonales en $[-\pi, \pi]$.

Por ejemplo:

$$\int_{-\pi}^{\pi} \cos mx \, \cos nx \, dx =$$

$$\frac{1}{2} \int_{-\pi}^{\pi} [\cos(m+n)x + \cos(m-n)x] \, dx =$$

$$\frac{1}{2} \left[\frac{\operatorname{sen}(m+n)x}{m+n} + \frac{\operatorname{sen}(m-n)x}{m-n} \right]_{x=-\pi}^{\pi}$$

$$= 0$$

Resultado clave:

Supongamos que $f(x)$ sea suave a tramos en $[-\pi, \pi]$, y que

$$F(x) = \sum_{n=0}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \operatorname{sen} nx$$

es la representación de Fourier de $f(x)$. Entonces, para $x \in [-\pi, \pi]$:

$$F(x) = \frac{f(x^+) + f(x^-)}{2}$$

Ejemplo:

$$f(x) = \begin{cases} -1, & -\pi \leq x < 0 \\ 1, & 0 \leq x < \pi \end{cases}$$

$$F(x) = \frac{4}{\pi} \sum_{n \text{ par}}^{\infty} \frac{\operatorname{sen} nx}{n} = \frac{4}{\pi} \sum_{n=0}^{\infty} \frac{\operatorname{sen}(2n+1)x}{2n+1}$$

$$= \frac{4}{\pi} \left(\operatorname{sen} x + \frac{\operatorname{sen} 3x}{3} + \frac{\operatorname{sen} 5x}{5} + \cdots \right)$$

Primeros dos términos:

$$F(x) = \frac{4}{\pi} \sum_{n \text{ par}}^{\infty} \frac{\operatorname{sen} nx}{n} = \frac{4}{\pi} \sum_{n=0}^{\infty} \frac{\operatorname{sen}(2n+1)x}{2n+1}$$

$$= \frac{4}{\pi} \left(\operatorname{sen} x + \frac{\operatorname{sen} 3x}{3} + \frac{\operatorname{sen} 5x}{5} + \cdots \right)$$

Primeros dos términos:

Agregando más términos:
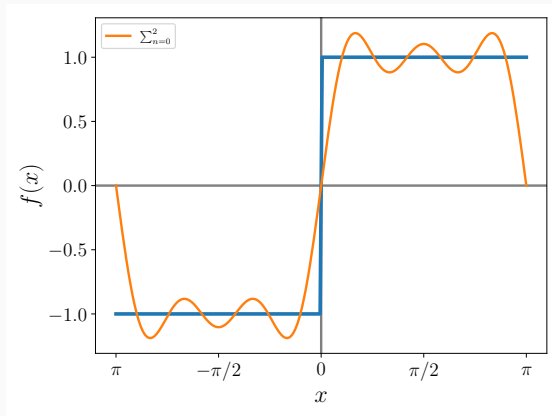

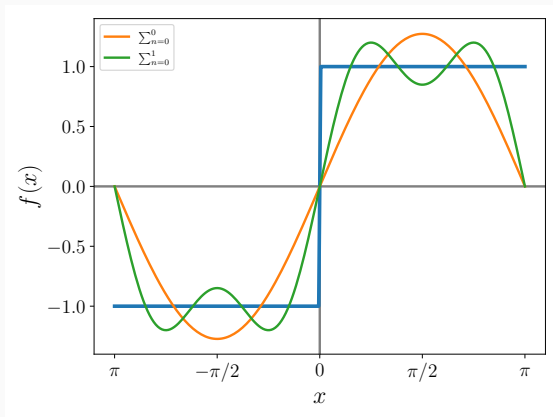

$$F_2(x) = \frac{4}{\pi} \left(\operatorname{sen} x + \frac{\operatorname{sen} 3x}{3} + \frac{\operatorname{sen} 5x}{5} \right)$$

3

$$F(x) = \frac{4}{\pi} \sum_{n \text{ par}}^{\infty} \frac{\text{sen } nx}{n} = \frac{4}{\pi} \sum_{n=0}^{\infty} \frac{\text{sen}(2n+1)x}{2n+1}$$

$$= \frac{4}{\pi} \left(\text{sen } x + \frac{\text{sen } 3x}{3} + \frac{\text{sen } 5x}{5} + \cdots \right)$$
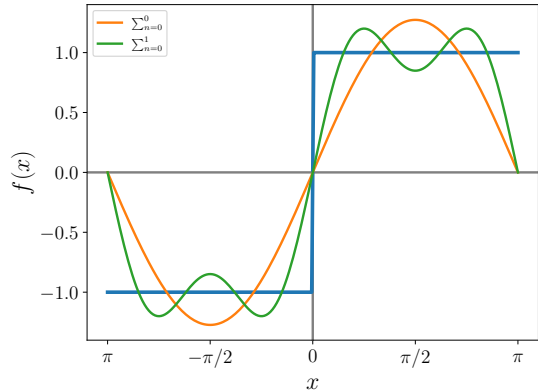

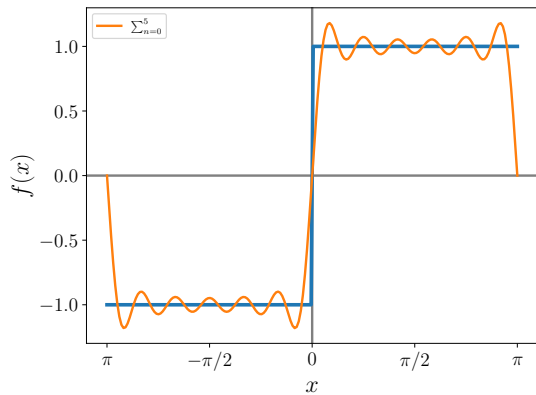

Agregando más términos:

Primeros dos términos:

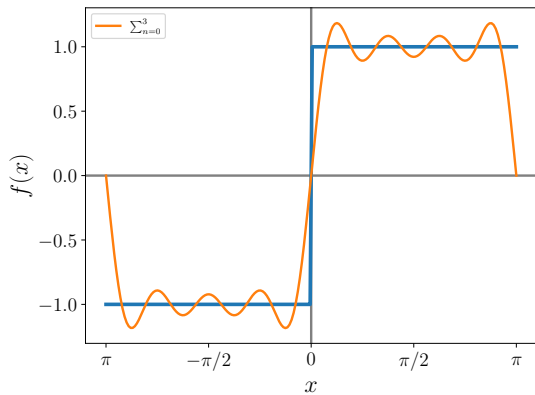

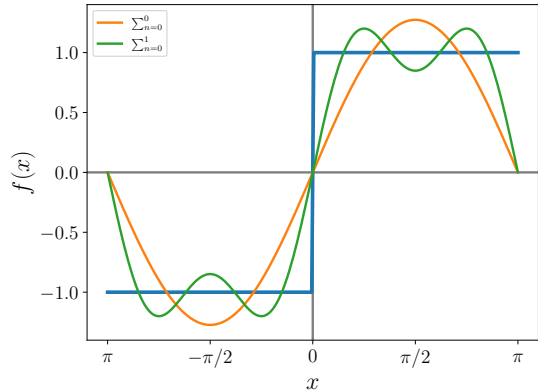

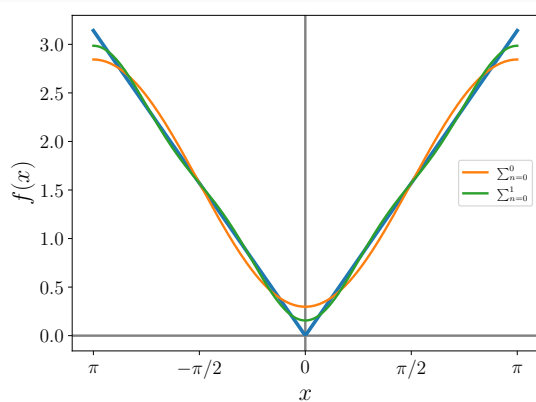

$$F_3(x) = \frac{4}{\pi} \left(\text{sen } x + \frac{\text{sen } 3x}{3} + \frac{\text{sen } 5x}{5} + \frac{\text{sen } 7x}{7} \right)$$

3

$$F(x) = \frac{4}{\pi} \sum_{n \text{ par}}^{\infty} \frac{\operatorname{sen} nx}{n} = \frac{4}{\pi} \sum_{n=0}^{\infty} \frac{\operatorname{sen}(2n+1)x}{2n+1}$$

$$= \frac{4}{\pi} \left(\operatorname{sen} x + \frac{\operatorname{sen} 3x}{3} + \frac{\operatorname{sen} 5x}{5} + \cdots \right)$$

Primeros dos términos:

Agregando más términos:

$$F_5(x) = \frac{4}{\pi} \left(\cdots + \frac{\operatorname{sen} 9x}{9} + \frac{\operatorname{sen} 11x}{11} + \frac{\operatorname{sen} 13x}{13} \right)$$

Otro ejemplo:

$$f(x) = |x|, \quad -\pi < x < \pi$$

$$F(x) = \frac{\pi}{2} - \frac{4}{\pi} \sum_{n \text{ impar}}^{\infty} \frac{\cos nx}{n^2}$$
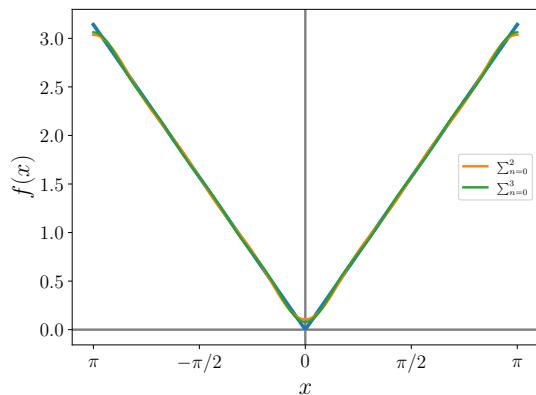

Otro ejemplo:

$$f(x) = |x|, \quad -\pi < x < \pi$$

$$F(x) = \frac{\pi}{2} - \frac{4}{\pi} \sum_{n \text{ impar}}^{\infty} \frac{\cos nx}{n^2}$$

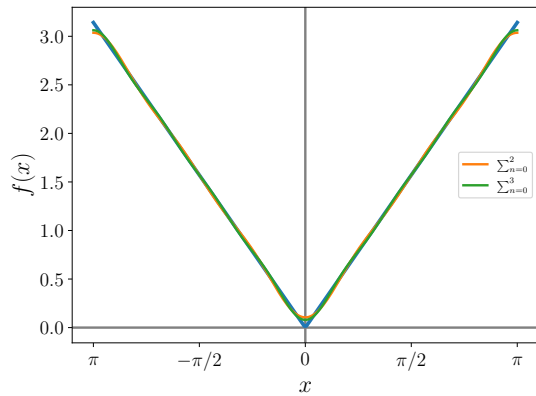

Comparación con serie de potencias:

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

$$= 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} + \frac{x^5}{120} + \cdots$$
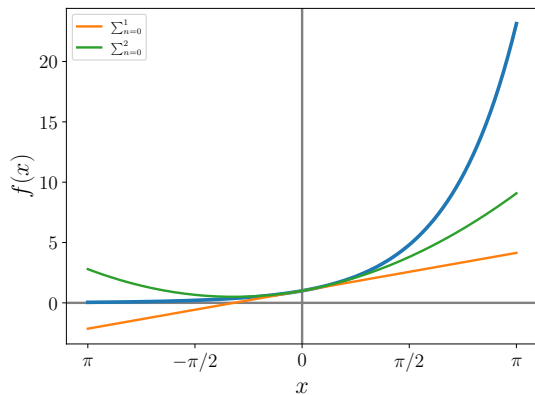

Otro ejemplo:

$$f(x) = |x|, \quad -\pi < x < \pi$$

$$F(x) = \frac{\pi}{2} - \frac{4}{\pi} \sum_{n \text{ impar}}^{\infty} \frac{\cos nx}{n^2}$$

Comparación con serie de potencias:

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

$$= 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} + \frac{x^5}{120} + \cdots$$

Otro ejemplo:

$$f(x) = |x|, \quad -\pi < x < \pi$$

$$F(x) = \frac{\pi}{2} - \frac{4}{\pi} \sum_{n \text{ impar}}^{\infty} \frac{\cos nx}{n^2}$$

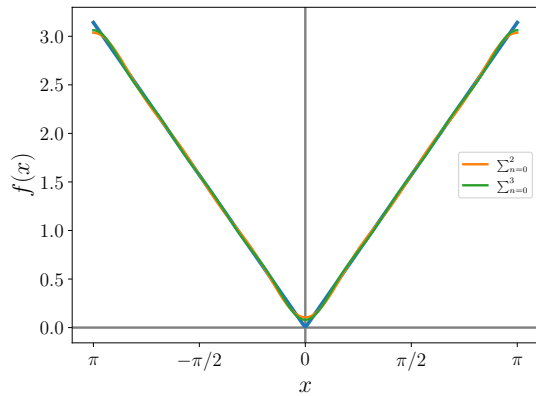

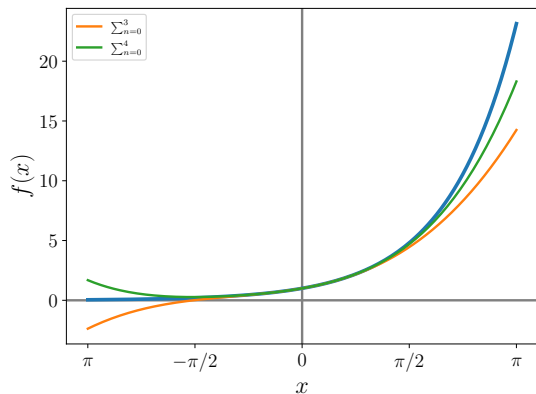

Comparación con serie de potencias:

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

$$= 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} + \frac{x^5}{120} + \cdots$$
